

## What is NT-proBNP?

B-type natriuretic peptide (BNP) which is produced in the cardiac myocytes increases with excessive stretching of the cells.<sup>2</sup> This proBNP is cleaved into BNP and a by-product called N-terminal pro-B type natriuretic peptide (NT-proBNP).<sup>1</sup> NT-proBNP is stable and has a long half-life, making it a more desirable biomarker.

## What NT-proBNP levels tell us

NT-proBNP concentration reflects the degree of cardiac activation secondary to stimulus, such as stretching<sup>2</sup>, allowing this marker to be used to assess the magnitude of cardiac muscle stretching.

#### To screen for occult heart disease

- · Prior to anesthesia
- In apparently healthy cats with heart murmurs
- · At risk breeds Maine Coon, Ragdoll, Birman, Persian

#### To determine Cardiac or Respiratory disease

- In Cats with respiratory signs such as dyspnea, tachypnea, cough
- To differentiate cardiac and respiratory causes of dyspnea

#### To determine the severity of heart disease

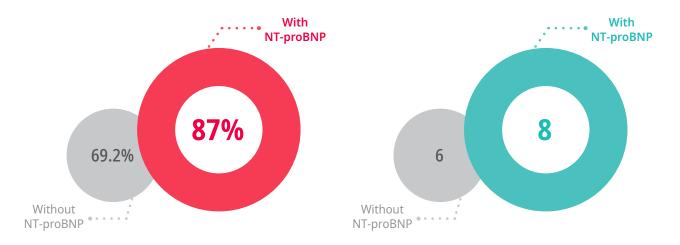

- For monitoring stabilization of CHF during hospitalization
- For predicting survival in cats with CHF<sup>4</sup>

\*CHF: Congestive Heart Failure

NT-proBNP should be interpreted in the context of other appropriate information, such as echocardiography, thoracic radiography, history and evaluation of clinical signs, to improve the accuracy of diagnosis.

# The accuracy of diagnosis

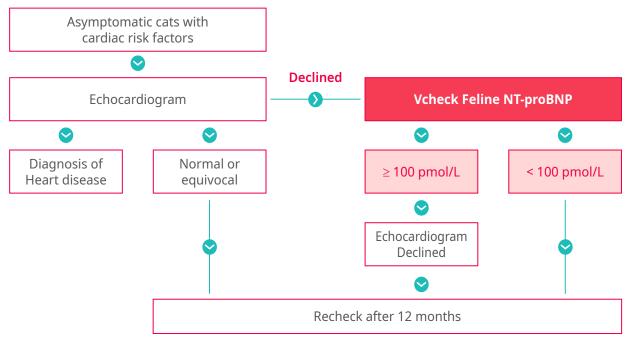

# The confidence score of diagnosis

The ability to differentiate cardiac from non-cardiac causes of respiratory signs is a vital initial step in achieving an accurate diagnosis and appropriate treatment.<sup>3</sup>

# **Clinical Algorithm**

NT-proBNP testing in cats<sup>5</sup>

By Dr. Sonya G Gordon (Cardiac Education Group)

#### **Specifications**

Species : Cat

• Sample : Serum, Plasma (Heparin, EDTA) 100 μl

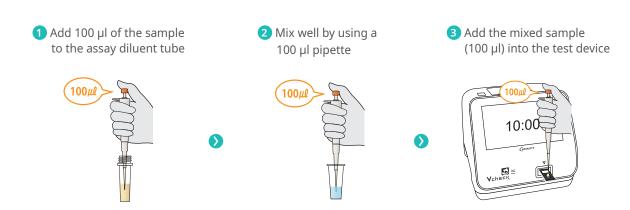

Testing Time: 10 minutesMeasurement: Quantitative

Measurement Range: 50 – 1,500 pmol/L

Storage Condition : 1 - 30 °C

#### **Test Procedure**

Samples should be centrifuged and tested immediately after collection. Alternatively, refrigerate and use within 24 hours or freeze.

\* Degradation of NT-proBNP may occur if stored at room temperature or refrigerated for more than 24 hours, leading to false negative results.

#### **Reference Ranges**

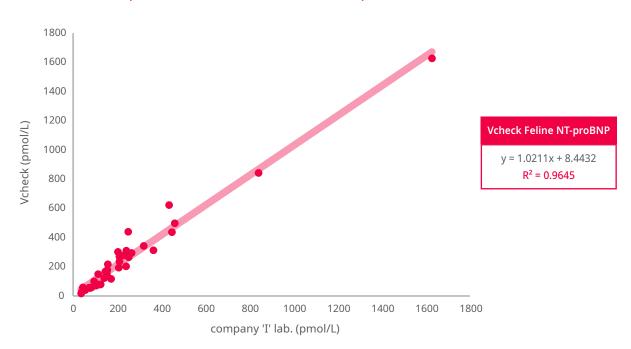

< 100 pmol/L	≥ 100 pmol/L	
Normal	Abnormal Additional diagnostics are recommended	

- A positive NT-proBNP test result should always be interpreted in combination and other diagnostic findings.
- In cats with respiratory signs, if the NT-proBNP is >270 pmol/L, CHF is the most likely cause of the clinical signs.

#### **Performance**

· Strong correlation with company 'I' laboratories

#### Comparative evaluation of Feline NT-proBNP (N=37)

#### **Reproducibility and Accuracy**

#### **Ordering Information**

Product No.	Product Name	Product Type	Packing Unit
VCF130DC	Vcheck Feline NT-proBNP	Device	5 Tests/Kit

#### **Key Features**

· Quantitative measurement

Quantifies the degree of elevation in NT-proBNP for an accurate evaluation

High correlation with company 'I' lab

Vcheck Feline NT-proBNP has a high correlation ( $R^2 = 0.96$ ) with company 'I' laboratory

A wide range of measurement

Measures up to 1500 pmol/L

A user-friendly procedure & Fast results

Simple one-step procedure, improving user convenience, and quick results within 10 min.

- In cats with Respiratory signs or Cardiac risk factors
- In high-risk cat breeds
- Preanesthesia evaluation
- For monitoring during hospitalization
- · For predicting a survival time

#### Cardiac risk factors in cats

- Gallop rhythm
- Heart murmurs
- Arrhythmia
- Radiographic cardiomegaly
- Left axis shift on an ECG
