# Biogal *ImmunoComb* In-Practice Diagnostic Kits

The ImmunoComb range of in-practice diagnostic kits, provide immediate answers to multiple canine, feline and avian diseases.

## Canine tests include:

- **ImmunoComb Canine Leptospira**

ImmunoComb Antibody Test Kit is an enzyme immunoassay for serologic diagnosis of canine leptospira. The ImmunoComb is very sensitive although not serovar specific, and is more user friendly than the conventional ELISA or MAT.
The kit is designed to to determine dog serum IgG antibody titre to Leptospira serovars mix: canicola, ichterohaemorrhagiae (copenhageni and RGA), pomona and grippotyphosa.

- **ImmunoComb Canine Parvo & Distemper IgM**

The ImmunoComb Canine Parvovirus and Distemper IgM Antibody Test Kit is designed to determine dog serum IgM antibody titre to Canine Parvovirus (CPV) and Canine Distemper Virus (CDV) which are recognised as important causes of illness and death in dogs. Puppies are most susceptible to CPV and CDV, especially after weaning when protective maternally derived antibody (MDA) levels decrease.

- **ImmunoComb Canine Brucella**

This kit is intended to screen for previous exposure to Brucella canis. Since many infected dogs have no clinical signs, and since Brucella canis bacteria are very persistent and rapidly transmitted, it is highly recommended to screen all dogs as a routine procedure, especially in breeding kennels and wherever dogs are kept together.

**Sensitivity:** 98% **Specificity:** 93%

- **ImmunoComb Canine Ehrlichia**

The ImmunoComb can detect Ehrlichia from a low positive titre, as early as 7 days after infection, through to the subclinical and chronic stages of the disease. It is easy to use, provides immediate results & is cost effective. The test is able to provide quantitative results quickly & efficiently, to identify dogs that have been exposed to E. canis.

**Quick, simple, reliable and portable Dot-ELISA Test Kits for pets**

**Results within 1 hour**

**Ready to use in-practice - no analyser required**

## Feline tests include:

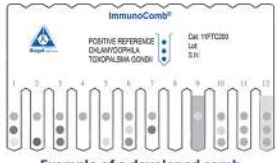
- **ImmunoComb Feline FCoV (FIP)**

For Feline Corona Virus (FCov) [FIP] antibody diagnosis, usually an IFA test is used. For this you need a lab, microscope and a trained technician. With ImmunoComb you can carry out all tests in the lab or practice without any need for lab equipment or specialised technical personnel, which means more flexibility, the saving of time, money and specialised resources.

- **ImmunoComb Feline Toxo & Chlamydophila**

The ImmunoComb Feline Toxoplasma and Chlamydophila (Chlamydia) Antibody Test Kit measures serum IgG antibody levels to Toxoplasma and Chlamydophila (Chlamydia) in cats. It is designed to monitor Chlamydophila sp. infections and may help in the diagnosis of these diseases when used together with other clinic pathological data.

| | | |
|---|---|---|
| T. gondii: | **Specificity:** 100% | **Sensitivity:** 92.3% |
| Chlamydophila sp.: | **Specificity:** 100% | **Sensitivity:** 94.7% |



Example of a developed comb

## Avian tests include:

- **ImmunoComb Avian Chlamydophila**

This kit is designed to determine IgG antibody titres to Chlamydophila psittaci (previously known as Chlamydia psittaci) in avian blood (or serum). The Avian Chlamydophila Test Kit assists in the clinical diagnosis of Chlamydophila psittaci infection in individual birds and identifies latently infected birds, in order to control bird-to-bird transmission and prevent potential human infection. It performs a serological follow-up and evaluation of the success of antibiotic treatment in sick birds.

## Step By Step Guide*

1) Obtain blood sample from dog/cat/bird
2) Mix reagents by gently shaking the developing plate several times
3) Pierce the aluminium cover & deposit a sample well into row A
4) Remove the teeth of the ImmunoComb card
5) Insert the comb into row A
6) Repeat for other rows
7) Let the comb dry before reading results
